Only buy what you need now; extend the functionality later

Extended Data License Key 

When this software license key is activated in the PSS (using a code), the data files (*BOR.xml*) available are populated with additional data. This data is then available to the Head Office applications via the HOST protocol.

Basic Funcs, Alarms & Pricing (Mandatory)

The Basic Functions, Alarms & Pricing module is a foundation module and must always be installed. It provides the following functionality:

- > Automatic retrieval of forecourt controller data
- > Alarm management
- > Time synchronization for the forecourt controller
- > Price management for the forecourt controller
- > Report capability for basic reports
- > License management for the PSS 5000

Performance Monitoring (Optional)

The Performance Monitoring module requires a license key to be active in the PSS before it is operational. It provides the following functionality:

- > Flow rate monitoring

Wetstock & Inventory (Optional)

The Wetstock & Inventory provides the following functionality:

- > Inventory overview for all the sites
- > Inventory reconciliation
- > Reports relating to inventory
- > Delivery history
- > Volume history
- > Sales predictions for the next 24 hours

Order & Distribution (Optional)

The Order & Distribution module can only be installed on top of the Wetstock & Inventory module and provides the following functionality:

- > Distribution overview
- > Order management
- > Reports related to orders
- > Automatic order creation
- > Order simulation to help planning

Understanding PSS License Management

By default, the PSS 5000 creates a number of data files. These standard data files contain a limited amount of data about the forecourt and the devices. This data is available to Head Office applications via the Doms HOST protocol.

When the Extended Data License Key is activated, the data files are populated with additional data, such as performance data and event status data. This extra data is now available to the Head Office applications, such as SiteInfo, and enable remote monitoring of multiple sites from a central location.
